

STEP 3 OF 6

Create your repository

A repository (“repo”) is just a folder. This one has a magic name.

Repository name

yourusername.github.io

Swap in your actual GitHub username — exactly, including capitalization

- Click the “+” in the top right → New repository
- Name it exactly: yourusername.github.io
- Set visibility to Public
- Check “Add a README file”
- Click Create repository

Why that exact name?

GitHub treats a repo named yourusername.github.io as your personal site's front door — it automatically becomes your homepage address. Any other name just makes a project page instead.

STEP 4 OF 6

Add your webpage file

No coding required — drag, drop, done.

Drag “index.html” here

(Yes, rename your file exactly index.html — that's the file GitHub looks for first)

- Open your repository on GitHub
- Click “Add file” → “Upload files”
- Drag in your index.html file
- Scroll down, click “Commit changes”

What's “commit”?

It's just GitHub's word for “save.” Nursing translation: it's like signing your charting entry. Once you commit, the change is on the record.

STEP 5 OF 6

Turn on GitHub Pages

One switch stands between you and a live website.

Give it a minute

GitHub needs about 60 seconds to “deploy” your page — basically taking its pulse before letting it out of recovery. A green checkmark under the Actions tab means it's ready.

Settings › Pages

Build and deployment

Source

Deploy from a branch

Branch

main / (root)

Save

→ *GitHub starts building your site immediately*

You're live.

Say hello to the internet's newest nursing faculty page.

What happens next

Bookmark it. Text it to a friend. Put it in your email signature today.

Changes you commit typically go live within a minute or two.

If it 404s, give GitHub another minute — patience, not panic.
